Recipes For Life
Appendix 6.3
Refactoring Strategy

- Remove unused or dead code.
- Comment and document each class and method within class.
- Make sure class and method names reveal purpose.
- If classes or methods are too large extract parts in to a new class or method.
- Make sure variable names are meaningful.
- Try to limit code duplication by placing the repeated code into a common method which can be accessed by all.
- Capital letters for classes and lowercase letters for methods.
